

Will we have the global organisational capacity to address the overshoot of the carrying capacity of the biosphere?

key assumptions for the next 25 years:

1. Overshoot of the carrying capacity of the biosphere is predetermined.
2. Resource constraints (peak oil, water scarcity, disappearing natural habitats, etc.) will impact human activity.
3. Most the technology to address this overshoot exist.
4. Technological progress will continue, and challenge our current beliefs in what is "human" and "natural".
